

BEANS

Bush Parker

Parker is a bush green bean that bears pods 14 - 15 cm long, 7 - 8 mm thick with a smooth skin. The jelly in Parker remains firm for quite a long time after picking. We recommend a plant stand of a minimum of 250m seeds per Ha. This should yield in excess of 11 t per Ha over 4 picks. Parker is resistant to Halo Blight, Common Bean Mosaic Virus and Anthracnose. Parker has shown an excellent field tolerance to rust.
